# StudyHub: Manage Your School Work

## Problem

Students struggle to keep up with school work and class activities. Students who cannot attend class fall further behind because they do not know what they missed or what to catch up on.

## Solution

StudyHub is a simple, mobile-friendly web app where a student can record every assignment, test, project, and class activity in one place. It also has a "Missed class" type so absent students can write down what they missed and the steps to catch up.

## Features

- Add items with a name, subject, type, due date, priority, and notes
- Types: assignment, test/exam, project, class activity, missed class (catch-up)
- Mark items done, filter by status and subject, and delete items
- Summary of open items, items due in the next 7 days, and overdue items
- Overdue and high-priority items are labelled in text, not only by colour
- Works on phones and computers, with large touch targets and keyboard support
- Light and dark mode follow the device setting
- Data is saved in the browser (localStorage). No account or server is needed.

## Live link

Open the published page: https://claude.ai/artifact/NVioxtaqhf75bqT8eKx8qx

## Run locally

1. Download `studyhub.html`.
2. Double-click it, or open it in any modern browser.
   No installation or internet connection is needed after the file is downloaded.

## Host on GitHub (free, with a live URL)

1. Create a new public repository on GitHub, for example `studyhub`.
2. Rename `studyhub.html` to `index.html` and upload it with this `README.md`.
3. Go to **Settings > Pages**, choose **Deploy from a branch**, select `main` and `/ (root)`, then save.
4. After about a minute the app is live at `https://<your-username>.github.io/studyhub/`.

## Accessibility

- Every input has a visible label, and icon-free controls have text labels.
- Buttons and inputs are at least 44 px high for easy tapping.
- Focus outlines are visible for keyboard users.
- Status changes are announced to screen readers ( `aria-live` ).
- Works with the device's text size and dark mode settings.

## Design notes

- One HTML file with no external libraries, so it loads fast and works on slow connections.
- Input is escaped before display to prevent script injection.
- Storage failures (for example, private browsing) are handled so the app still works for the session.

## Limitations and next steps

- Data stays on one device and one browser. A future version could add sign-in and cloud sync.
- No reminders or push notifications yet. These could be added with the Notifications API.
- Class timetables and shared notes between students are not included yet.
